

BELLABEAT

How Can a Wellness Company Play It Smart?

A look at smart device usage data and what it means for marketing

By Jake Chervitz | Google Data Analytics Capstone

What Bellabeat wants to figure out

01

What Bellabeat asked

Look at how people are using smart fitness devices in general, and figure out what that could mean for Bellabeat's app marketing.

02

Product I picked

The Bellabeat app — it's the layer connecting Leaf, Time, and Spring, and it's where users actually engage with the brand day to day.

03

How I went about it

Two months of public FitBit data from 35 users, cleaned in Python, turned into findings, then into specific suggestions worth A/B testing.

What we worked with

35

FitBit users

61

days of data

46K+

hourly observations

4

data files used

TOOLS

Python (pandas, matplotlib, seaborn) for the heavy lifting. Excel and PowerPoint for the final visuals and this deck.

WHAT IT CAN'T TELL US

- Small sample (35 users) — findings are directional, not airtight
- No demographic data — can't confirm match with Bellabeat's women-focused audience
- 2016 data — pre-pandemic, before remote work changed sitting habits
- Sleep data only covers 24 of 35 users (about 70%)

FINDING 1

There's no "typical" user — segments split evenly

SO WHAT?

Each tier holds 23–29% of users. No tier is bigger than 30%.

A single message can't reach more than a quarter of users well. The data points pretty clearly toward building four user personas.

FINDING 2

People sit a lot. Like, a lot.

79%

sedentary

vs. only 3% in fairly or very active states.

That's 26 sedentary minutes for every 1 genuinely active minute.
Even the most active users sit most of the day.

The biggest health lever is probably reducing sitting time, not adding more workouts.

FINDING 3

Activity peaks at 7 PM with a clear afternoon dip

NOTIFICATION WINDOWS

1–4 PM

Movement nudges

Activity dips between lunch and the evening peak — the perfect window to nudge.

9–10 PM

Bedtime prep

Activity is already winding down — natural moment to suggest going to bed.

FINDING 4

A third of sleep-trackers get under 6 hours per night

46%

meet the 7-hour minimum

33%

sleep less than 6 hours

92%

sleep efficiency (high)

High efficiency + low duration = the issue is bedtime, not biology.

FINDING 5

Sitting more = sleeping less (the strongest signal in the data)

CORRELATION WITH SLEEP

Sedentary minutes -0.64

Total steps -0.20

Very active min -0.09

Reducing sitting time might improve fitness AND sleep — pretty good two-for-one.

Five suggestions for the Bellabeat app

01

Different messages for different users

Build content streams for each tier. Stop using one voice for everyone.

02

Lean into sitting less

Make movement minutes the hero metric. Less "track your workout," more "stand up."

03

Time notifications better

Movement nudges in the 1–4 PM lull. Bedtime prompts at 9–10 PM.

04

Real sleep coaching

Build a "bedtime drift" feature. The fix is going to bed earlier, not sleep quality.

05

Re-engage lapsed users

Notify at 3 days, email at 7, digest at 14. Skip streak-based shaming.

How we'd know each one is working

01 Different messaging

A/B test segmented vs. unsegmented push notifications. Track open rate and click-through over 30 days.

02 Lean into sitting less

Month-over-month drop in average sedentary minutes per active user.

03 Time notifications better

Engagement rate on time-targeted vs. ad-hoc notifications. Step lift in the hour after.

04 Real sleep coaching

Average sleep duration among bedtime-reminder users. Conversion to paid Bellabeat membership.

05 Re-engage lapsed users

Reactivation rate within 14 days of lapse. Retention at 30, 60, 90 days post-reactivation.

N E X T S T E P S

Where this could go next

- Get current data — 2016 behavior probably doesn't match 2025
- Use Bellabeat's own user data instead of FitBit's
- Add demographics to confirm patterns hold for the target audience
- A/B test the segmented messaging idea against current copy
- Connect engagement metrics to actual subscription conversion

Thanks for reading.
